*Structural Dynamics of Rocket Engines* May 07 2020 This  
is the first Structural Dynamics book focused on this  
indispensable aspect of liquid rocket engine design. This  
book begins by reviewing basic concepts in Structural  
Dynamics, including the free and forced response of  
SDOF and MDOF systems, along with some discussion of  
how numerical solutions are generated. The book then  
moves to a discussion of specific applications of these  
techniques in LREs, progressing from component level  
(turbomachinery and combustion devices), up through  
engine system looks, and finally to integration with a  
launch vehicle. Clarifies specific topics including the  
Campbell and SAFE Diagrams for resonance  
identification in turbomachinery, the complications of  
component analysis in the pump side due to a host of  
complication factors such as acoustic/structure  
interaction, the "side-loads" fluid/structure interaction

problem in overexpanded rocket nozzles, and competing methods for generation overall engine system interface loads. Includes specific examples for illustration while closing with rotordynamic analysis, dynamic data analysis, and vibroacoustics.
